**Flexible Sinus-Lift Curettes – for an optimum sensitivity during the direct lift procedure**

The perforation of the Schneiderian membrane is a complication that often occurs during a maxillary sinus floor augmentation procedure. The Sinus Lift curettes increase the sensitivity by blunt and flexible working tips with Swing-Effect. Because of their special shapes and the characteristics of the stainless steel between the handle and the active part, light pressure is continued and gives the operator a direct and sensitive response. At the same time the risk to perforate the Schneiderian membrane is reduced to a minimum. Already at the development the focus was a practicable handling. Because of varying angulations and shapes of the active parts also in difficult areas they are easy to manipulate also in difficult areas. The set of curettes consists of six different figures for every situation. They are complemented by spoon and curettes to place the bone graft.

The Schneider's Membrane of the sinus can be detached with curettes by 1–2 mm along the bone apical base.

Curette 4 particularly useful in the lower part for detaching the membrane further. The same goes for the buccal area, especially when the membrane is 4–5 mm above the base of the maxillary sinus and the maxillary sinus is built up with granular material.

Curette makes it possible to lift the membrane further in apical region. One working tip is especially designed for the right maxillary sinus and the other for the left maxillary sinus.

With curette the bone membrane is further removed in the upper and posterior part of the maxillary sinus wall.

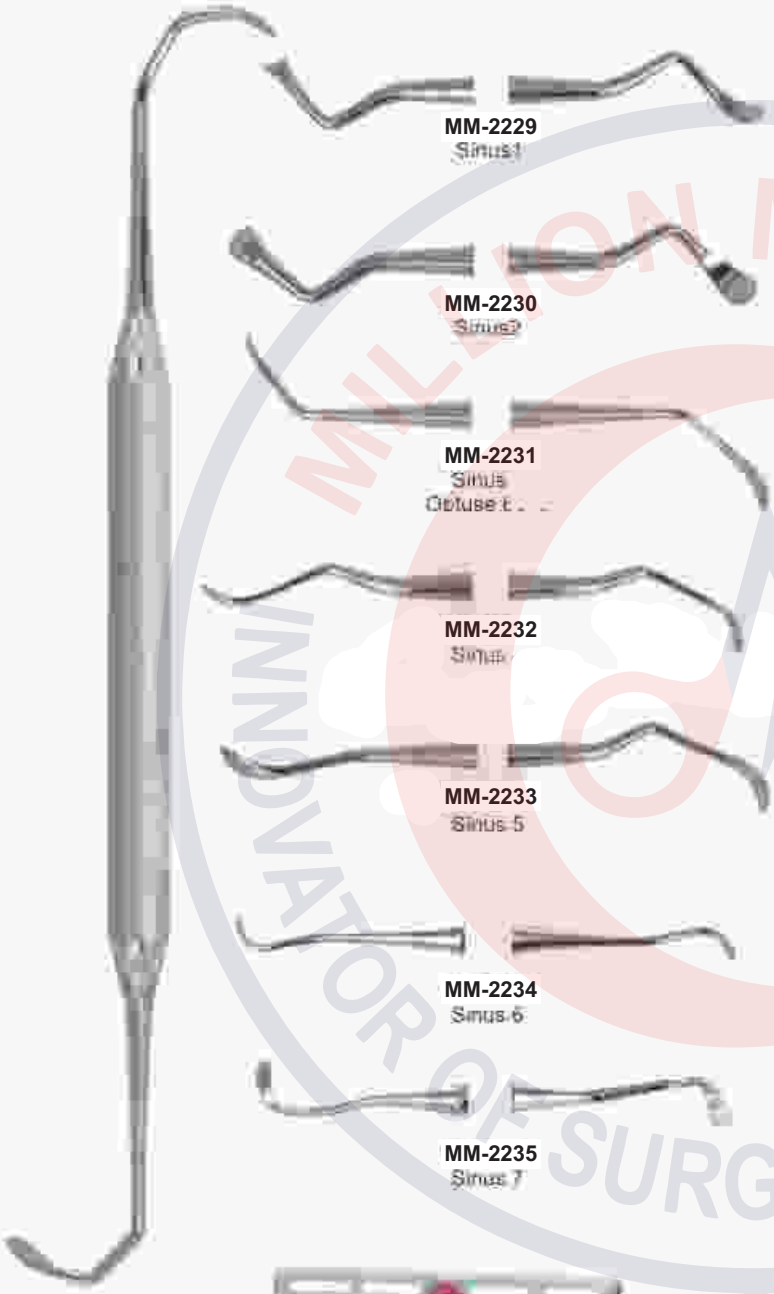

With curette the bone membrane is further detached over a broad area in the upper region, especially along the roof of the palate.
